

## **Bold Question Set 4**

In 2030, my sister will graduate high school and start college. Current third graders across the country will. That's a little scary to think about. Mainly because they are all 8 or 9 years old right now. Hopefully at that time my family will still be in San Antonio and my sister can start at UTSA. Based on what I have seen of my sister and her friends, the future students at UTSA will be very successful. They will be smart, ambitious, and be an active voice for current issues of the world as no other generation has. I'm excited to see what they will do for the community and the world. The year 2050 will be a similar but different story. That could very likely be the year my own child would start college. That is very odd to think about. The challenges they would be facing will be very different from mine, although I am currently facing a global pandemic. Hopefully this generation of UTSA students will be the best yet. By then global acceptance of race, sexuality, and gender will be very possible. That generation will fight to maintain climate change and for endangered species. The farther we look into the future, the more modern the generations get. They will speak out for issues and causes they believe in for the betterment of not only the United States, but the whole globe as well. My role in the future will most likely be an active alumni. I would love to help future students navigate college. The challenges I have already faced have allowed me to help my friends still in high school to better prepare for college. I can't wait to see the future student body of UTSA.
