College of Charleston Libraries

Context

Marine Resources Library
A SC Marine Resources Center Partner

- Specialized Marine Science Library
- Graduate Students
- State/Federal scientists
- One librarian/one assistant

Why should scientists learn Python?

DATA

The word "DATA" is written in large, bold, blue capital letters. Below the letters, the silhouettes of two people, a man and a woman, are standing next to the letter "A", providing a sense of scale.

Why Python?

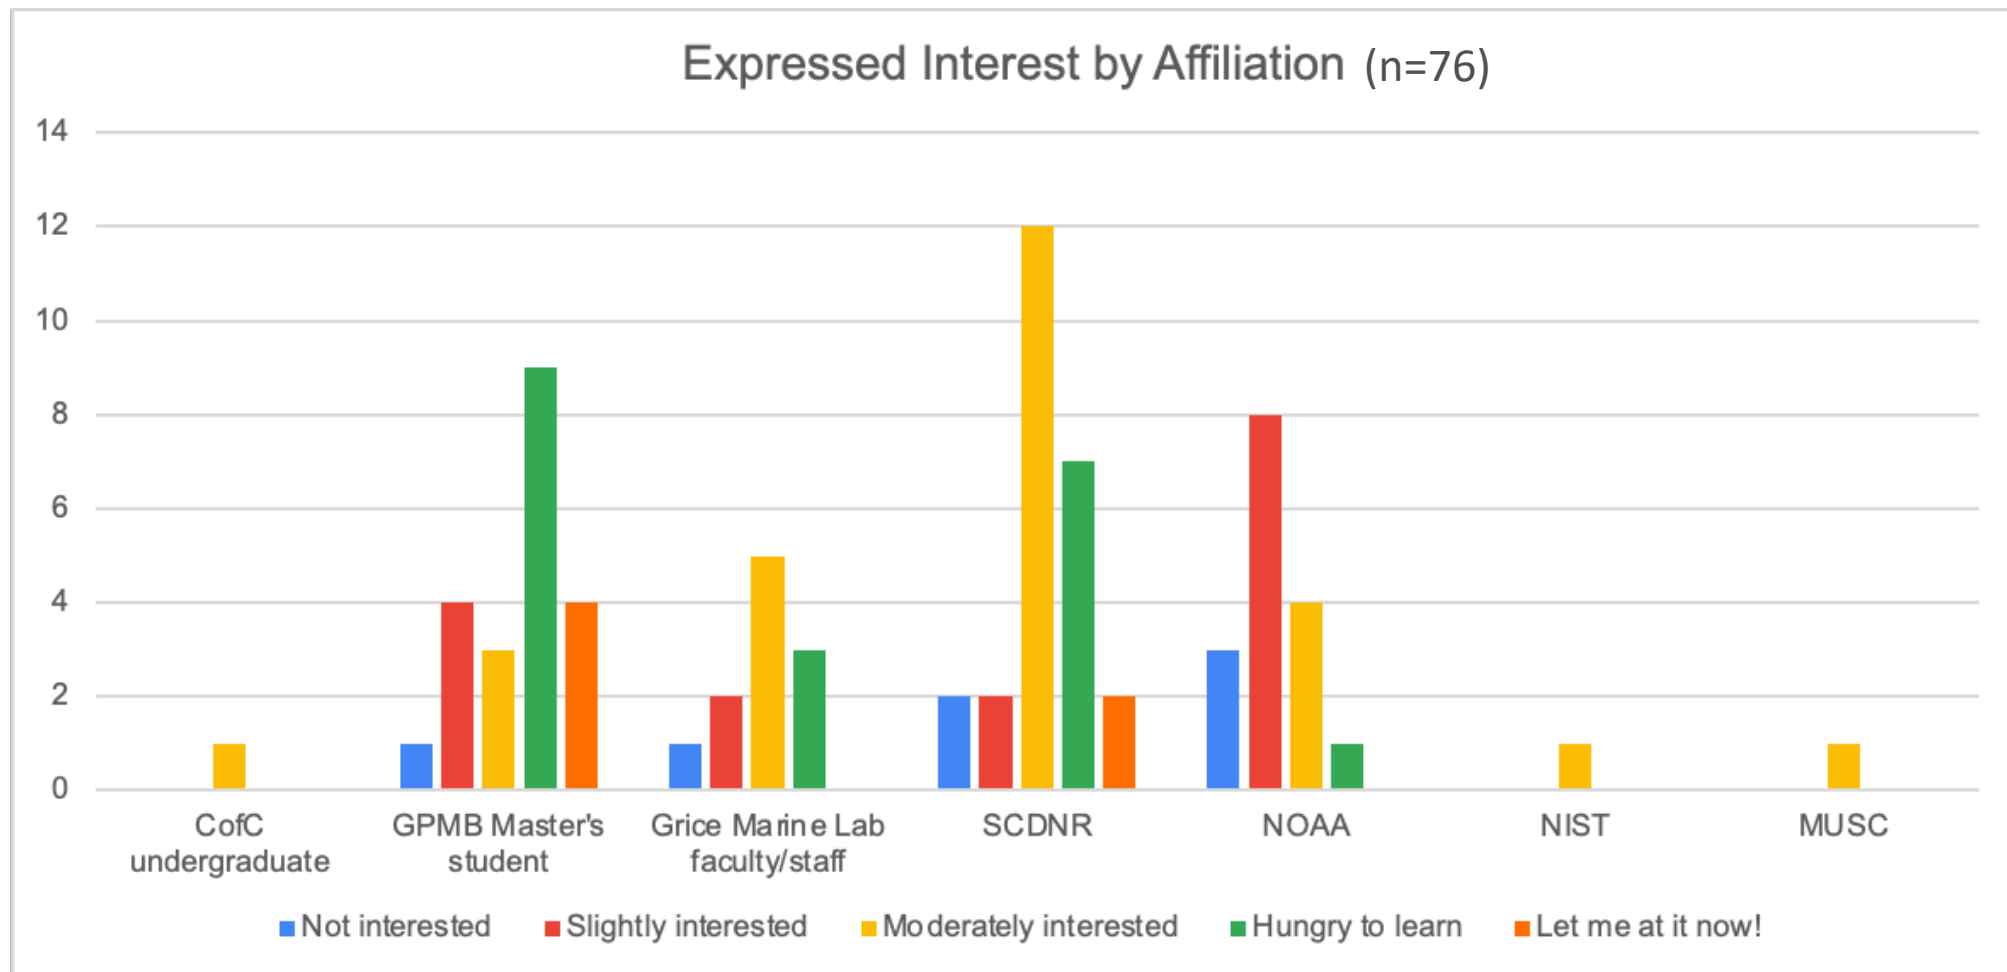

- Open source
- Widely used
- Highly readable
- Custom packages
- Support community
- General purpose

<https://www.python.org/>

MRL survey of constituents

Course design

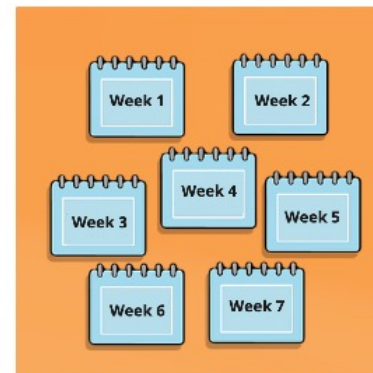

1. Small groups

3. Cloud-based environment

4. Concise

5. Scaffolded

7. Hands-on

2. In person

6. Foundational

Python competencies by week

1. Orient to platform;
Understand data types & structures
2. Read content from iterables
3. Structure code with functions
4. Read and write CSV files
5. Find data/patterns within data
6. Get data from APIs
7. Structure code with classes

Welcome to Session 6 - Getting Web-Based Data

Much useful data is available online and can be accessed with a script. Application Programming Interfaces (APIs) make data available using URLs that are requested (accessed) by the script. The data are delivered in a predictable format for use.

Requesting Data

The requests Library

The Python requests library is a simple HTTP library for interacting with web content. Requests is not included with Python; it must be installed on your system to import it.

To make a request using a URL, we will use the requests library's `get()` function, written as `requests.get()`

This has two basic aspects:

1. The base URL, which specifies the API address and the specific API application, or feature, that is requested
2. Data which forms the context of our request, to pass to the API as part of the URL

We'll use the [World Register of Marine Species \(WoRMS\) API](#) which is called Aphia.

```
[ ]: import requests

# We'll use the API to get the currently accepted species ID for Sciaenops ocellatus
# The API URL root (used for all Aphia API applications) is https://www.marinespecies.org/rest
# The specific API application to get the accepted species ID is /AphiaIDByName/{ScientificName}
# An example complete URL to get the AphiaID for Sciaenops ocellatus is https://www.marinespecies.org/rest/AphiaIDByName/Sciaenops ocellatus

sciname = 'Sciaenops ocellatus'
aphiaID = requests.get(f'https://www.marinespecies.org/rest/AphiaIDByName/{sciname}')
print(aphiaID)
```

Let's take a closer look at our request string

What is a Jupyter Notebook?

```

Web-based environment

GitHub

- Free repository
- Stores content
- Binder config file
- Jupyter Notebook files
- CSV files

 **binder**

- Free service
- Creates Docker image of Python, using config file

- Free service
- Serves Docker image/Jupyter Lab on the Web

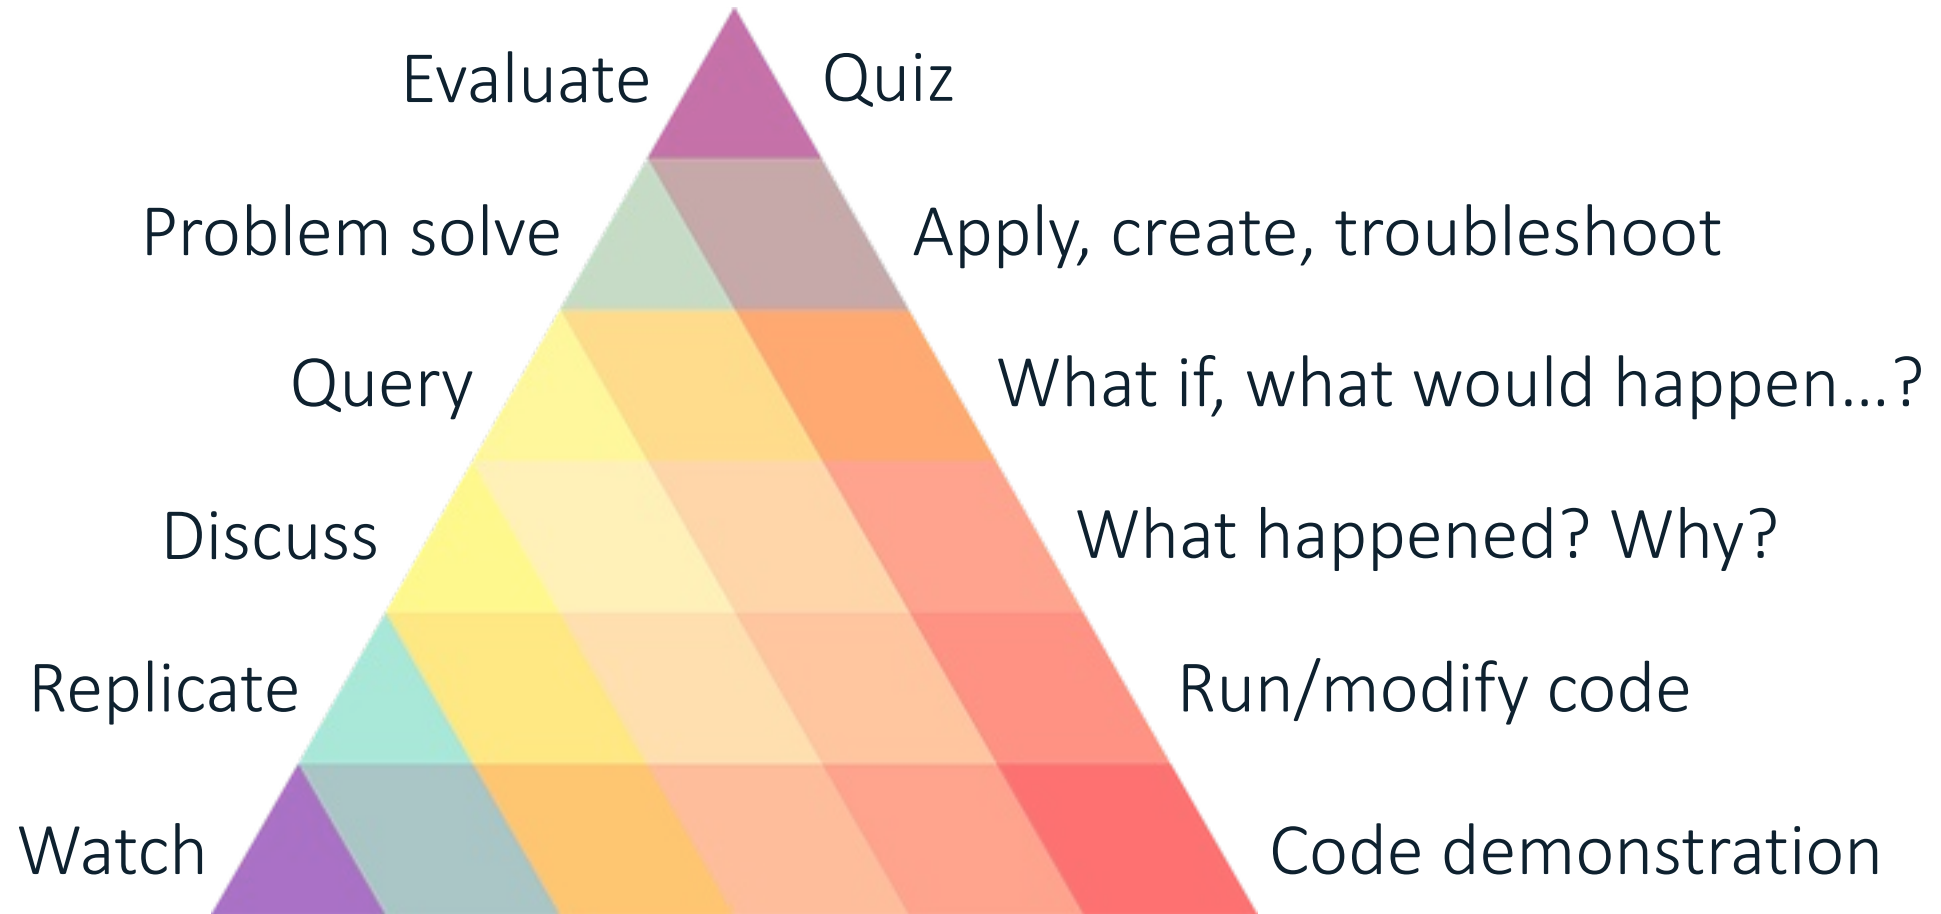

**Interactive Python
environment with
no installation**

See <https://the-turing-way.netlify.app/communication/binder/zero-to-binder.html>

Scaffolded learning

Active Learning: Consolidate knowledge

Activity 1

Use the AphiaID number generated by the provided code to get the vernaculars (common names) for *Sciaenops ocellatus* from the WoRMS API

1. The specific WoRMS API application to get the vernaculars for a given AphiaID is `/AphiaVernacularsByAphiaID/{aphiaID}`
2. Remember to unpack the JSON response
3. Print the unpacked response
4. Iterate over the data and print each vernacular in the form: "Vernacular (Language)" When you're done with Activity 1, please indicate your completion on the [Miro Board](#).

[1]: *# You'll need this code*

```
import requests
sciname = 'Sciaenops ocellatus'
aphiaID = requests.get(f'https://www.marinespecies.org/rest/AphiaIDByName/{sciname}').json()

# Tackle Activity 1 here

vernaculars = requests.get(f'https://www.marinespecies.org/rest/AphiaVernacularsByAphiaID/{aphiaID}').json()
for vernac in vernaculars:
    print(f"{vernac['vernacular']} ({vernac['language']})")
```

```
channel bass (English)
corvineta ocelada (Spanish)
red drum (English)
rode ombervis (Dutch)
roter Trommler (German)
tambour rouge (French)
```

Higher order thinking: Problem solving

Activity 4

Using *Callinectes sapidus* as the species, write a script to use the Aphia API to accomplish the following:

1. Import the requests library.
2. Find the AphiaID for *Callinectes sapidus* (using `/AphiaIDByName/{species name}`).
3. Use the AphiaID to get all synonyms for the species' scientific name (using `/AphiaSynonymsByAphiaID/{ID}`).
4. Look at the output and iterate over it (no need for a recursive function here) to extract the synonym's scientific name, authority, and status, as well as the valid species name, and valid authority. Print a sentence using the data points to inform the reader about the unaccepted name and authority for the species and the currently accepted name and authority for the species.

```
[ ]: #Tackle Activity 4 here
```

Registration

- Two cohorts of 9 initially offered
- Demand for third cohort
- Three cohorts launched
- Waitlist of 6

Affiliation	Registration Count	Full Participation Count
College of Charleston (Graduate student)	6	6
SC Department of Natural Resources	16	16
NOAA	5	3
Totals	27	25

Expressed Expectations

How do you hope to use Python in the future?

Learning Aspiration	Count (n=22 stickies)
GIS	11
Data analysis	7
Data collection automation	2
Genetics/Genomics	2
Develop applications/advanced scripting	2
Not sure	2
Modeling	1

Analyze images of oyster reefs and develop GIS application about oyster recruitment

Best laid plans

-
- Demand to go hybrid (Zoom + in person)
 - Recordings requested
 - Schedule conflicts = ~~cohorts~~
 - Mixed skill levels/expectations
 - Roll with the punches!

Outcomes

How important was it to you to be able to access recordings of the Python training?

How intuitive/easy to use did you find the Jupyter Notebooks?

How important was it for your learning experience to interact directly with Python code during the training sessions?

How useful to your learning experience were the activities where you were asked to attempt to apply what had just been taught?

How important was it to you to be able to continue to interact with the notebooks after each week's session was over?

Outcomes

As an introductory course assuming no background in either programming or Python, how useful was the content we chose for the course to introduce you to programming in Python?

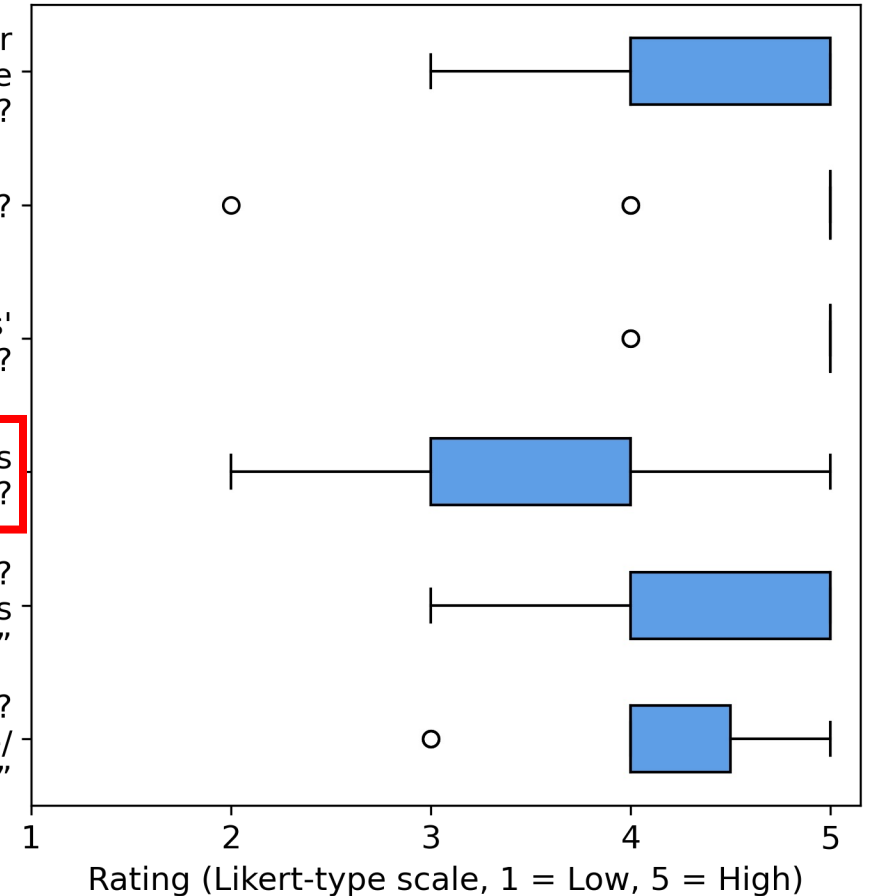

How well prepared was the course learning content?

How responsive were the instructors to participants' questions, queries, and problems experienced?

How useful were the post-session quizzes in helping your learning process?

To what extent do you agree with this statement?
"I am more aware of how Python can be used as a tool in my work/research"

To what extent do you agree with this statement?
"I am more confident about beginning to use/continuing to learn about Python in my work/research"

Could we offer this? (But I don't know Python)

- Library as facilitator
 - Coordinate/host training
 - Curate learning resources/online guide
 - Python Users Group
 - Showcase Python-based projects
- Great opportunity for partnerships!
- Learn Python!

What next?

- Update intro course
 - New session: Python installation (Anaconda package)
 - Use participant's datasets
- Prepare short higher-level courses in:
 - Data analysis (Pandas library)
 - Data visualization (Matplotlib library)

From Zero to Python in 10.5 Hours
